

19MA605 COMPUTATIONAL LINEAR ALGEBRA, DIFFERENTIAL EQUATIONS AND PROBABILITY THEORY 3-1-0-4

Linear Algebra: Matrix, Geometry of linear equations, Vector spaces and subspaces, linear independence, basis and dimensions, linear transformations, applications of linear transformations, inner product space, Orthogonality, projections and least square applications, Eigen values and Eigen vectors. Ordinary Differential Equations and applications of integration: Separable first order differential equations, exact first order differential equations, applications of differential equations, Linear homogeneous differential equations with constant coefficients, method of undetermined coefficients, Variation of Parameters, techniques and applications of integration. Probability: Random Variables, Mass and Density Functions, Conditional Probability, Conditional Expectation, Independence, Correlation, Special Distributions and their Generating Functions, Binomial, Poisson, Normal, Linear Combinations of Normal Variables, Limit Theorems, Types of Convergence, Continuity Theorem, Central Limit Theorem. Laboratory Practice: Case studies and simulation experiments in system modelling, path planning, estimation and detection and so on.

19EM602 DIGITAL SIGNAL CONTROLLERS 3-0-2-4

Digital Signal controllers: Introduction, file registers, memory organization, interrupts, electrical characteristics, peripherals: Ports, Timer, ADC, USART, PWM Channels. Signal generation: PWM, SPWM and servo signals. Filtering algorithms: FIR filters, IIR filters, Control Algorithms: P, PI, PID controllers, Fourier Transforms: DFT, FFT, DCT algorithms. Simulation/hardware experiments with latest digital signal controllers. Lab Practice: Interfacing power electronic switches, voltage and current measurement techniques, digital ammeter and voltmeter, PWM generation for Servo Motor control, harmonics analysis in DSC using FFT.

19EM601 DYNAMICS OF LINEAR AND NONLINEAR SYSTEMS

2-0-2-3

Overview: Introduction to control system design. Time domain and frequency domain techniques: compensators, controllers, Concept of controllability and Observability: Kalman's and Gilbert's tests. Design of control system in state space: Pole placement controller, control law design for full state feedback, design of servo systems. Observer design: Reduced order observer, design of regulator systems with observers. Case study: Computer aided designs. Introduction to nonlinear and time-varying systems. Mathematical background: norms, Lipschitz continuity, Lp norms for signals and Lp spaces, induced norms for systems. Existence and uniqueness of solutions to nonlinear differential equations. Linearization through Taylor's series, Hartman-Grobman Theorem. Characteristics of nonlinear systems. Second order systems, Phase plane techniques, Describing Functions, Lyapunov based Design. Lab Practice: Simulation/hardware experiments in design of compensators, controllers, observers, linearization, nonlinear system analysis with the help of an example from industries.

19EM611 MODELLING AND IDENTIFICATION OF DYNAMIC SYSTEMS 3-0-2-4

Modelling by first principle approach of simple mechanical, electrical, thermal, chemical systems. Modelling by energy approach using Lagrangian and Hamiltonian, bond graph modelling of dynamical systems. Classical methods of system identification:

Identification of system transfer function, Fourier analysis and spectral analysis. Sampling, Discrete domain to continuous domain conversion techniques. Offline methods of parameter estimation: least squares method, Generalized Least squares method, Instrumental Variable method (IV), Maximum Likelihood estimation. Stochastic modelling: Regression methods, Linear regression model, Polynomial Models. Online Identification methods: Recursive Least squares (RLS). Identification of multivariable systems and closed loop systems, order reduction of higher order systems, aggregation method. Lab Practice: Hardware/simulation of system identification case study using classical methods, least square estimates, stochastic modelling and so on.

19EM612

EMBEDDED CONTROL SYSTEM

3-0-2-4

Review of control system design: closed loop control, analysis of control loops, time and frequency domain specifications, stability. Approaches for controller design. Practical realization of a control loop. Controller Implementation: architecture of embedded controllers and description of various components. Design and implementation of control loops, choice of embedded computing platforms- Real-time Operating Systems, Tiny Operating systems, I/O and communication, scheduling algorithms and their performance analysis, real-time issues in co-design implementation. Validation techniques for embedded control systems. Model Based Control System Design: discrete systems, notion of state, Finite State Machines, Extended State Machines, Model based design, code generation, verification and validation, HIL, MIL, SIL, PIL. Performance assessment of control algorithms on the target implementation architectures. Case studies from automotive, aerospace, process control and other application domains.

19EM613

PROCESS CONTROL AND AUTOMATION

3-0-2-4

Process Modelling: hierarchies. Theoretical models: transfer function, state space models, and time series models. Development of empirical models from process data, chemical reactor modelling. Feedback & feed forward control, cascade control, selective control loops, ratio control, feed forward and ratio, split range, selective, override, auctioneering, adaptive and inferential controls. Multi-loop and multivariable control: process interactions, Singular value decomposition, Relative gain array, I/O pairing. Decoupling and design of non-interactive control loops. Statistical process control, supervisory control, direct digital control, distributed control, Introduction to Automatic Control: PC based automation. SCADA in process automation. Time Delay Systems and Inverse Response Systems, Special Control Structures, Introduction to Sequence Control, PLC, RLL, Sequence Control. Scan Cycle, Simple RLL Programs, Sequence Control. RLL Elements, RLL Syntax, Lab practice: Implementation of RLL, sequence control etc. using PLC Hardware Environment

19EM614

DIGITAL CONTROL FOR AUTOMATION

3-0-2-4

Review of Z-transforms. Pulse transfer function. Digital control system: sampling, quantization, data reconstruction and filtering of sampled signals. Mathematical modelling of sampling process. Simulation examples- effect of sampling rate. Analysis of filters in discrete domain. Z-transform analysis of closed loop and open loop systems, multirate Z - transform. Stability analysis of closed loop systems in the z- plane: root loci, frequency domain analysis, Stability tests. Discrete equivalents. Digital controller design for SISO systems: design based on root locus method in the z-plane, design based on frequency response method, design of lag compensator, lead compensator, lag lead compensator, design of PID Controller based on frequency response method, direct design, method of Ragazzini. 2DOF discrete PID controller- software approach. State space representation in discrete system. Controllability, observability, control law design, decoupling by state variable feedback, effect of sampling period. Estimator/ Observer Design: full order observers, reduced order observers, regulator design. Discrete LQR design. Introduction to event

triggered systems: examples using state flow technique. Real-Time Applications of Computer-Aided Design. Case Study: Simulation/hardware experiments in controller, observer/estimator, design for automation. Use of IOT based systems for process control and automation.

19EM615

OPTIMAL AND ADAPTIVE CONTROL3-0-2-4

Optimal control problem: fundamental concepts and theorems of calculus of variations. Euler - Lagrange equation and extremal of functional, the variational approach to solving optimal control problems, Hamiltonian and different boundary conditions for optimal control problem. Linear regulator problem: LQR/LQG controller design, applications to practical systems. Multi objective optimization techniques, genetic algorithm. Introduction to Model Predictive Control (MPC): State space MPC, prediction model, Objective function, constraints and optimization. Pontryagin's minimum principle, dynamic programming, principle of optimality and its application to optimal control problem, Hamilton-Jacobi-Bellman equation. Discrete time optimal Control Systems. Adaptive control: Closed loop and open loop adaptive control. Self-tuning controller, parameter estimation using least square and recursive least square techniques, gain scheduling, model reference adaptive systems (MRAS), self-tuning regulators. Variable Structure Control.

SMART SENSING AND SIGNAL PROCESSING 3-0-2-4

Sensors Fundamentals: Sensor classification, Thermal sensors, Humidity sensors, Capacitive sensors, Electromagnetic sensors, Light sensing technology, Moisture sensing technology, Carbon dioxide (CO₂) sensing technology, Sensors parameters, Selection of sensors. Interfacing of Sensors and Signal Conditioning: Change of bias and level of signals, Loading effects on Sensor's output, Potential divider, Low-Pass RC filter, High-Pass RC filter, practical issues of designing passive filters. Op-amp circuits in Instrumentation: Instrumentation amplifier, Isolation Amplifier, current to voltage and voltage to current converter. Active Filters: Transfer function, First order active filters, Standard second order responses, KRC filters, Multiple feedback filters, Sensitivity, Filter approximations, Cascade design, Direct design, Switched capacitor, Switched capacitor filter. Wireless sensors and sensors network: Introduction, Frequency of wireless communication, Development of wireless sensor network based project, Wireless sensor network based on only Zigbee. Use of Arduino for Signal conditioning and signal processing: Study of ADC, Using maths operations and filter operations in Arduino. Smart Transducers: Smart Sensors, Components of Smart Sensors, General Architecture of Smart Sensors, Evolution of Smart Sensors, Advantages, Application area of Smart Sensors. Introduction to Embedded Web servers, IOT cloud based data storage and processing. Lab experiments: Simulation/hardware experiments in filters, amplifiers, signal processing using Arduino, wireless sensor networks.

19EM603

APPLICATION DEVELOPMENT LABORATORY 1-0-2-2

The student in consultation with the faculty advisor has to select a topic related to Control and Instrumentation area, write a paper and present it. Lab training sessions in commonly used ICs and kits (Microcontrollers, FPGA kits etc) to prepare students for project phase.

19RM600

RESEARCH METHODOLOGY

2-0-0-2

Unit I:

Meaning of Research, Types of Research, Research Process, Problem definition, Objectives of Research, Research Questions, Research design, Approaches to Research, Quantitative vs. Qualitative Approach, Understanding Theory, Building and Validating Theoretical Models,

Exploratory vs. Confirmatory Research, Experimental vs Theoretical Research, Importance of reasoning in research.

Unit II:

Problem Formulation, Understanding Modeling & Simulation, Conducting Literature Review, Referencing, Information Sources, Information Retrieval, Role of libraries in Information Retrieval, Tools for identifying literatures, Indexing and abstracting services, Citation indexes

Unit III:

Experimental Research: Cause effect relationship, Development of Hypothesis, Measurement Systems Analysis, Error Propagation, Validity of experiments, Statistical Design of Experiments, Field Experiments, Data/Variable Types & Classification, Data collection, Numerical and Graphical Data Analysis: Sampling, Observation, Surveys, Inferential Statistics, and Interpretation of Results

Unit IV:

Preparation of Dissertation and Research Papers, Tables and illustrations, Guidelines for writing the abstract, introduction, methodology, results and discussion, conclusion sections of a manuscript. References, Citation and listing system of documents

Unit V:

Intellectual property rights (IPR) - patents-copyrights-Trademarks-Industrial design geographical indication. Ethics of Research- Scientific Misconduct- Forms of Scientific Misconduct. Plagiarism, Unscientific practices in thesis work, Ethics in science

INTELLIGENT CONTROL SYSTEMS 3-0-0-3

Introduction to Neural Networks, Artificial Neural Network (ANN) based control: ANN Architectures, Classification Taxonomy of ANN-Connectivity, Learning Strategy: Supervised, Unsupervised, Reinforcement, Learning Rules. Feed Forward Neural Networks, Perceptron Models: Discrete, Continuous and Multi-Category, Training Algorithms: Backpropagation (BP) algorithm, Competitive Learning, Vector Quantization, Self Organized Learning Networks, Kohonen Networks, Radial Basis function (RBF). Artificial Neural Network application: inverse model approach, direct model reference control, model predictive control, indirect adaptive controller design using neural network. Fuzzy logic based control: fuzzy controllers, preliminaries, Mamdani and Sugeno inference methods, fuzzy sets in commercial products, defuzzification, basic construction of fuzzy controller, fuzzy PI, PD and PID control, T-S fuzzy model, Neural and fuzzy-neural networks.

Geneticalgorithm: basics of Genetic Algorithms, design issues in Genetic Algorithm, geneticmodelling, hybrid approach, GA based fuzzy model identification, Particle SwarmOptimization: concept, algorithm, PSO variations and applications. Ant colonyoptimization. Mathematical modelling of intelligent robotic systems. Lab Practice:Simulation/ Hardware experiments in Neural control, Fuzzy logic control and Comparisonof optimization algorithms in a selected case study.

19EM702

ROBOTICS AND CONTROL

3-0-0-3

Mathematical representations of rigid bodies in 3D space, the concept of a 4 x 4 homogeneous transformations and elementary screw theory. Lab: Different kinds of actuators and their mathematical models: stepper, DC servo and AC motors, model of a DC servo motor, sensors: internal and external sensors, common sensors, encoders, tachometers, strain gauge based force-torque sensors, proximity and distance measuring sensors and vision.Symbolic representation of robots: representation of joints, link representation using D-H parameters, kinematics of serial robot. Direct Kinematics: forward solutions for Stanford and PUMA robots, Inverse Kinematics: inverse (back) solution by Geometric approach with co-ordinate transformation and manipulation of symbolic T and A matrices. Lab: Software simulation of manipulators. Wheeled mobile robots: Kinematic models of holonomic and non-holonomic mobile robots, modelling of slip. Introduction to ROS. Lab: Application of modern control systems on wheeled mobile robots: Navigation of differential drive mobile robots Software simulation and hardware demonstration. Laboratory Experiments: Simulation/Hardware experiments on the topics as mentioned above.

FLIGHT DYNAMICS AND CONTROL

3-0-0-3

Aerodynamic forces: lift, drag and moment coefficients-variation with angle of attack aerodynamic center, Aircraft Performance: drag polar of vehicles from low speed to hypersonic speed. Six DOF Equations of motion of aircraft. Aircraft Stability and Control: longitudinal and lateral dynamics stability, conditions for longitudinal static stability. Modes of motion: Short period, phugoid, spiral divergence, Dutch roll, stability derivatives, roll coupling. Aircraft transfer functions, control surface actuator, longitudinal autopilots, displacement autopilot, pitch autopilot, lateral, autopilots, yaw and roll autopilots, attitude control systems stability augmentation, numerical problems. Dynamics and control of Launch Vehicles (SLV). Inertial sensors: Gyros, accelerometers, MEMS devices for aerospace navigation, IMU. Navigational aids: Instrument landing system, radar, GPS. Lab practice: simulation/case study of SLV, autopilot.

19EM704

VIRTUAL INSTRUMENTATION 3-0-0-3

Virtual Instrumentation: Historical perspective, advantages, block diagram and architecture of a virtual instrument, data flow techniques, graphical programming in data flow, comparison with conventional programming. Development of Virtual Instrument using GUI, Real-time systems, Embedded Controller, OPC, HMI / SCADA software, Active X programming. VI programming techniques: VIS and sub - VIS, loops and charts, arrays, clusters and graphs, case and sequence structures, formula nodes, local and global variables, string and file I/O, Instrument Drivers, Publishing measurement data in the web. Data acquisition basics: Introduction to data acquisition on PC, Sampling fundamentals, Input/output techniques and buses. ADC, DAC, Digital I/O, counters and timers, DMA, Software and hardware installation, Calibration, Resolution, Data acquisition interfacing requirements. VI Chassis

requirements. Common Instrument Interfaces: Current loop, RS232C/ RS485, GPIB. Bus Interfaces: USB, PCMCIA, VXI, SCSI, PCI, PXI, Fire wire. PXI system controllers, Ethernet control of PXI. Networking basics for office & Industrial applications, VISA and IVI. VI toolsets, distributed I/O modules. Application of Virtual Instrumentation: Instrument Control, Development of Process database management system, Simulation of systems using VI, Development of Control system, Industrial Communication, Image acquisition and processing, Motion Control. Lab Practice: Simulation Experiments in Instrument control, Image acquisition and processing and so on.

LOGIC AND DISTRIBUTED CONTROL SYSTEMS 3-0-0-3

Data loggers, Data Acquisition Systems (DAS), Direct Digital Control (DDC). Supervisory Control and Data Acquisition Systems (SCADA), sampling considerations. Functional block diagram of computer control systems, alarms, interrupts. Characteristics of digital data, controller software, linearization. Digital controller modes: Error, proportional, derivative and composite controller modes. PLC: Evolution, Components, advantages over relay logic, Architecture, Programming devices, Discrete and Analog I/O modules. Programming languages, Ladder diagrams, timers and counters. Instructions in PLC: Program control instructions, math instructions, sequencer instructions. Use of PC as PLC, Case studies using PLC. DCS Architectures, Comparison, Local control unit. Process interfacing issues. Communication facilities, configuration of DCS, displays, redundancy concept. Lab Practice: Simulation/hardware experiments in DAS, digital controllers, programming in PLC and so on.

19EM706

ROBUST CONTROL 3-0-0-3

Norms for signals and systems, input output relationships, internal stability, asymptotic tracking, performance. Uncertainty and robustness: plant uncertainty, robust stability, robust performance. Stabilization: controller parameterization for stable plant, coprime factorization, controller parameterization for general plant, asymptotic properties, strong and simultaneous stabilization. Design constraints: algebraic constraints, analytic constraints. Design for performance: unstable, design example, 2-norm minimization. Stability Margin Optimization: optimal robust stability, gain margin optimization, phase margin optimization. Loop Shaping, Sliding mode control and H_∞ control. Applications in control design. Lab Practice: Simulation experiments in loop shaping, H_∞ control and so on.

19EM707 ADVANCED DIGITAL SIGNAL CONTROLLERS AND APPLICATIONS 3-0-0-3

Pre-requisite: General background of microprocessors and microcontrollers. Overview of Digital signal controllers: C2000 modules, Piccolo based controllers, Delfino based controllers, MAC units, hardware divide support, floating point signal processing support. dsPIC30F series DSC- CPU, data memory, program Memory, instruction set. Programming using XC16 compiler and C- Interrupt Structure. Peripherals of dsPIC30F: I/O Ports, timers, input capture, output compare, motor control PWM, 10 bit A/D converter, UART.

Applications using dsPIC30F: Generating SPWM, generating PWM's for power converters, PID based control loops, signal processing based on FIR and IIR filter structures, developing single and multi-point communications with dsPIC and other IC's. Lab Practice: FIR/IIR Filters, FFT, PID control loops and communication systems using dsPIC30F2010.

19EM708 ESTIMATION THEORY AND STOCHASTIC CONTROL 3-0-0-3

Estimation Theory: Cramer Rao Lower Bound. Linear Modeling. Estimation Techniques: Least Squares Estimation, Recursive Least Squares Estimation, Best Linear Unbiased Estimation, Likelihood and Maximum Likelihood Estimation. Bayesian Philosophy: Maximum A posteriori Estimation, Wiener Filter, Kalman Filter. Dynamic programming: basic problem, min-max control, set membership function. Stochastic Control: stochastic integrals, analysis of dynamical systems with stochastic inputs. Lab Practice: Simulation experiments in Wiener Filter, Kalman Filter, Least square estimation, Cramer Rao bound and soon. **TEXT BOOKS/ REFERENCES:**

19EM709 MULTI AGENT SYSTEMS 3-0-0-3

Introduction to Multi Agent Systems, Intelligent Agents: the design of intelligent agents, reasoning agents (eg: AgentO), agents as reactive systems (eg: subsumption architecture), hybrid agents (eg: PRS), layered agents (eg: Interrap) a contemporary (Java-based) framework for programming agents (eg: JADE Java Agent Development Environment). Multi-Agent Systems: Classifying multi-agent interactions, cooperative versus noncompetitive, zero-sum and other interactions, cooperation, the Prisoner's dilemma and Axelrod's experiments. Interactions between self-interested agents: auctions & voting systems, negotiation. Interactions between benevolent agents: cooperative

distributed problem solving (CDPS), partial global planning, coherence and coordination. Interaction languages and protocols: speech acts, KQML/KIF, the FIPA framework. Application to multi-UAV systems: Formation control with time-varying topology, Formation control with connectivity maintenance, Steady-state behaviours, Bearing-based formation control, formation of autonomous vehicles and consensus. Application to multi-UGV systems: Cooperative Mobile Manipulations, Cooperative exploration of unknown environments, Mutual localization with anonymous measurements, Target localization and encircling.

POWER PLANT INSTRUMENTATION 3-0-0-3

Introduction: Importance of Instrumentation and control in power generation, piping and instrumentation diagrams. Instrumentation and control in water circuit: boiler feed water circulation, measurements, controls, impurities in water and steam. Instrumentation and control in air-fuel circuit: measurements, controls, analytical measurements. Turbine monitoring and control: classification of turbines, instrumentation and control points of view, principal parts of turbines, turbine steam inlet system, turbine measurements, turbine control system, lubrication for turbo-alternator, turbo alternator cooling system. Basic principles of a nuclear plant. Nuclear power plant training simulator project. Design concepts of instrumentation and control of CWR, PWR and BWR reactors (different examples). Operator/Plant communication systems, main control systems, safety and safety related systems. Role of Instrumentation in hydroelectric power plant. Regulation and monitoring of voltage and frequency of output power. Pollution and effluent monitoring and control. Energy management. Electrical substation controls. Plant safety and redundancies of non-conventional power plants. Diesel generator controls. Laboratory Practice: Simulation of intelligent control strategies in instrumentation, SCADA and so on.

ELECTRIC DRIVES AND CONTROL 3-0-0-3

Fundamentals of electric drives, dynamics of electric drives, multi quadrant operation, closed loop control of drives. Review of DC and AC Motor Drives: Primitive machine: unified approach to the analysis of electrical machine, basic two pole model of rotating machines, Kron's primitive machine: voltage, power and torque equation, linear transformation from 3 phase to 2 phase and from rotating axes to stationary axes, invariance of power. Principle of vector Control: vector controlled induction motor drive, basic principle, direct rotor flux oriented vector control, estimation of rotor flux and torque, implementation with current source and voltage source inverters. Stator flux oriented vector control, indirect rotor flux oriented vector control scheme, implementation, tuning (include lab practice). Vector control strategies for synchronous motor. Introduction to sensor-less control, basic principle of direct torque control, MRAS, PLC based control.

19EM712

MODERN OPTIMIZATION TECHNIQUES 3-0-0-3

Historical Development, Engineering applications of Optimization. Art of Modelling: Objective function, Constraints and Constraint surface, Formulation of design problems as mathematical programming problems. Classification of optimization problems: Optimization techniques, classical and advanced techniques, Functions of single and two variables, Stationary points, Global Optimum, Convexity and concavity of functions of one and two variables, optimization of function of one variable and multiple variables,

Gradient vectors, Examples. Optimization of function of multiple variables subject to equality constraints: Lagrangian Function, Hessian matrix formulation, Kuhn-Tucker Conditions, Examples. Advanced Topics in optimization: Piecewise linear approximation of a nonlinear function, Direct and indirect search methods. Evolutionary algorithms for optimization: Working Principles of Genetic Algorithm, genetic Operators, Selection, Crossover and Mutation, Issues in GA implementation. Particle Swarm Optimization: Fundamental principle, Velocity Updating, Advanced operators, Parameter selection. Simulated annealing algorithm, Tabu search algorithm, Ant colony optimization, Bacteria Foraging optimization. Multi objective optimization: Weighted and constrained methods, Multi level optimization, Concept of Pareto optimality. Lab Practice: simulation based experiments / Case studies in path planning, Trajectory optimization, Drive Control and so on.

19EM713 GUIDANCE AND CONTROL OF AUTONOMOUS SYSTEMS 3-0-0-3

Introduction to the concepts of navigation, guidance and control. General principles of early conventional navigation systems, Geometric concepts of navigation, Reference frames. Inertial navigation: Gyros and Accelerometers, Inertial platforms: stabilised platforms, gimbaled and strap down INS. Stabilization and Control of spacecrafts, Missile control systems and Autopilots, Launch vehicle flight control systems. Longitudinal and lateral autopilots for aircraft, Radar systems, Command and Homing guidance systems. Introduction to Manipulators and Mobile Robots: Direct Kinematics, Co-Ordinate Frames, Rotations, Homogeneous Coordinates, the Arm Equation. Kinematic Navigation and Guidance of Mobile Robots: Path Planning, Single Axis PID Control, PD Gravity Control, Computed Torque Control, Variable Structure Control, Impedance Control.

19EM714

BIOMEDICAL INSTRUMENTATION 3-0-0-3

Basics of biomedical instrumentation: Terminology, medical measurements, constraints, Classification of biomedical instruments. Introduction to biological system modelling: electrical and ionic properties of cellular membranes, sources and theories of bioelectric potentials. Biomedical Transducers: types of transducers used in bio-instrumentation. Recording electrodes: electrodes theory, biopotential Electrodes, biochemical electrodes Biomedical signal measurement Basics: Bio amplifiers, Measurement of Ph, Oxygen and Therapeutic and prosthetic devices: cardiac pacemakers, defibrillators, hemodynamic & haemodialysis, ventilators, infant incubators, surgical instruments. Therapeutic Applications of Laser. Cardiovascular measurements: blood flow, pressure, cardiac output and impedance measurements, plethysmography. Measurement of heart sounds: introduction to Electrocardiography (ECG), elements of intensive care. Monitoring: heart rate Monitors, Arrhythmia Monitors. EEG & EMG: anatomy and functions of brain, bioelectric potentials from brain, resting rhythms, clinical EEG. Instrumentation techniques of Electroencephalography, Electromyography. Medical imaging systems: radiography, MRI, Computed Tomography, Ultrasonography. Non-invasive Instrumentation: t measurements, principles of Ultrasonic measurements, ultrasonic and its applications in medicine. Biotelemetry: introduction to biotelemetry, physiological parameters adaptable to biotelemetry, biotelemetry system components, implantable units and applications of telemetry in patient care. Lab Practice: Simulation Experiments in EEG, ECG, EMG, Defibrillator, Pacemaker and so on.

19EM715

SMART ELECTRICAL NETWORKS AND INTELLIGENT

COMMUNICATIONS SYSTEMS 3-0-0-3

Data communication, Communication channels: Wireless and Wired communication. Layered architecture and protocols: ISO/OSI, TCP/IP models. Communication technologies: IEEE 802, Multi-protocol label switching, Power line communication. Protocols and standards for information exchange- Standards for smart metering, Modbus, DNP3, IEC 61850, Ethernet, Power line carrier communication, CAN Bus, I2C, LIN Bus protocol, Modbus protocol structure: Profibus protocol stack, Profibus communication model, Bluetooth, ZigBee, IEEE 801.11-a,b,g,n, Z-Wave, Cellular networks, WiMAX. Sensing measurement control and automation technologies. Communications infrastructure and protocols for smart metering: Home area network, Neighbourhood area network, Data concentrator, Meter data

management system. Demand side integration, Services provided by DSI, Hardware support to DSI implementations, system support. Distribution automation equipment: Substation automation, IED, Remote terminal units. Distribution management systems, SCADA, Modelling and analysis tools. Application: System monitoring, operation and management, Interactions in autonomy-stability, Inference and predictions, hierarchical control, decentralized control, swarm robotics. Networked control systems: Time driven, Event driven feedback schemes.

AUTOMOTIVE CONTROL SYSTEM DESIGN

3-0-0-3

Automotive Systems Overview: Automotive Vehicle Technology, Overview of Vehicle Categories, Various Vehicle Sub Systems. Future Trends in Automotive Embedded Systems: Hybrid Vehicles, Electric Vehicles. Automotive Sensory System: Automotive Sensors and Transducers: Proximity Distance Sensors, Engine Speed sensor, Throttle Position Sensor, Pressure Sensors, Knock Sensor & Mass Flow Sensor. Automotive Control System Design : Digital Engine Control, Features, Control Modes for Fuel Control, Discrete Time Idle Speed Control, EGR Control, Variable Valve Timing Control, Electronic Ignition Control, Integrated Engine Control System, Summary of Control Modes, Cruise Control System, adaptive cruise control, Cruise Control Electronics, Anti-locking Braking System, Electronic Suspension System, Electronic Steering Control, Four-Wheel Steering, drive by wire system, ESP, Traction Control System, Active Suspension System, HVAC, vehicle immobilization and deactivation system, parking system, body electronics and central locking system. Automotive Protocols: LIN, CAN, FlexRay, Test, Calibration and Diagnostics tools for networking of electronic systems like ECU Software and Testing Tools, ECU Calibration Tools, AUTOSAR Architecture. Trends in Automotive Electronics: Intelligent Transportation System, V2V, V2I communication, Vehicle Network Simulation, autonomous vehicles architecture, control methods in autonomous vehicle navigation, vehicle platoon.

BIOLOGICAL CONTROL SYSTEMS 3-0-0-3

Biological Control Systems Analysis. Comparison of Engineering and Biological Control System. Mathematical modelling of Biological (Physiological) Systems: Transfer function and State-Space Analysis, Computer Analysis and Simulation. Static Analysis of Biological Systems: Regulation of Cardiac Output, Regulation of Glucose, Chemical

Regulation of Ventilation. Time-Domain Analysis: Linearized Respiratory Mechanics, Dynamics of Neuromuscular Reflex Motion. Frequency-Domain Analysis of Biological systems: Frequency Response of a Model of Circulatory Control, Frequency Response of Glucose-Insulin Regulation. Stability Analysis: Stability Analysis of the Pupillary Light Reflex Model of Cheyne-Stokes Breathing. Identification of Biological Control Systems: Identification of Closed-Loop Systems, Case studies. Optimization in Biological Control: Adaptive Control of Biological Variables. Nonlinear Analysis of Biological Control Systems: Models of Neuronal Dynamics

NONLINEAR SYSTEM ANALYSIS AND CONTROL 3-0-0-3

Introduction to nonlinear and time-varying systems. Mathematical background: norms, Lipschitz continuity, L_p norms for signals and L_p spaces, induced norms for systems. Existence and uniqueness of solutions to nonlinear differential equations. Linearization through Taylor's series, Hartman-Grobman Theorem. Characteristics of nonlinear systems. Second order systems, Phase plane techniques, Poincaré-Bendixson Theorem, periodic orbits, stability of periodic solutions, slow and fast manifolds. Input-output analysis and stability- Small gain theorem, passivity, describing functions. Stability of nonlinear systems: Lyapunov stability, local linearization and stability in the small, direct method of Lyapunov, La Salle's invariance principle and singular perturbation. Lyapunov function for linear and nonlinear systems, variable gradient method, centre manifold theorem, input-output stability, stability of state models, L_2 stability. Lyapunov based design, back stepping, sliding mode control, Analysis of feedback systems, circle criterion, Popov criterion, simultaneous Lyapunov functions. Feedback linearization, input state linearization, input output linearization, full state linearization, harmonic linearization, filter hypothesis, stabilization, regulation via integral control, tracking. Gain scheduling. Zero dynamics, MIMO systems, non-minimum phase systems, singularities. Introduction to variable structure control. Laboratory Practice: Simulation / hardware experiments in controller design, linearization, tracking and so on.

ADVANCED DIGITAL SIGNAL PROCESSING

3-0-0-3

Discrete and random signal processing: Wide sense stationary process – Ergodic process – Mean – Variance - Auto-correlation and Autocorrelation matrix - Properties - Wiener Khitchine relation - Power spectral density – filtering random process, Spectral Factorization Theorem–Finite Data records, Simulation of uniformly distributed/Gaussian distributed white noise – Simulation of Sine wave mixed with Additive White Gaussian Noise. Spectrum Estimation: Bias and Consistency of estimators - Non-Parametric methods - Correlation method - Co-variance estimator - Performance analysis of estimators – Unbiased consistent estimators - Periodogram estimator - Barlett spectrum estimation - Welch estimation. Linear Estimation and Prediction Model based approach - AR, MA, ARMA Signal modeling - Parameter estimation using Yule-Walker method - Maximum likelihood criterion - Efficiency of estimator - Least mean squared error criterion – Wiener filter - Discrete Wiener Hoff equations – Mean square error. Adaptive filters: Recursive estimators - Kalman filter - Linear prediction – Forward prediction and Backward prediction, Prediction error - Whitening filter, Inverse filter - Levinson recursion, Lattice realization, Levinson recursion algorithm for solving Toeplitz system of equations. Multirate DSP: FIR Adaptive filters - Newton's steepest descent method - Adaptive filters based on steepest descent method - Widrow Hoff LMS Adaptive algorithm - Adaptive channel equalization - Adaptive echo canceller - Adaptive noise cancellation - RLS Adaptive filters - Exponentially weighted RLS – Sliding window RLS - Simplified IIR LMS Adaptive filter.

ROBOTICS FOR INDUSTRIAL AUTOMATION

3-0-0-3

Prerequisite: Mathematics -Vector Algebra, Introduction: Automation and Robotics, Historical Development, Definitions, Basic Structure of Robots, Robot Anatomy, Classification of Robots, Fundamentals about Robot Technology, Factors related to use Robots, Robot Performance, Basic Robot Configuration. Kinematics of Robot Manipulator: Introduction, General Mathematical Preliminaries on Vectors & Matrices, Direct Kinematics problem, Geometry Based Direct kinematics problem, Robotic Manipulator Joint Co-ordinate System, Euler Angle & Euler Transformations, Roll Pitch-Yaw (RPY) Transformation. DH

Representation & Displacement Matrices for Standard Configurations, Jacobian Transformation in Robotic Manipulation. Dynamics of Robotic Manipulators: Introduction, Preliminary Definitions, Generalized Robotic Coordinates, Jacobian for a Two link Manipulator, Euler Equations, Lagrangian Equations of motion. Application of Lagrange–Euler (LE) for Dynamic Modeling of Robotic Manipulators.
